Foreword

This Ethiopian Standard has been prepared under the direction of the Technical Committee for Animal and vegetables fats and oils (TC 23) and published by the Ethiopian Standards Agency (ESA).

The standard is identical with ISO 12193:2004, Animal and vegetable fats and oils - Determination of lead by direct graphite furnace atomic absorption spectroscopy published by International Organization for Standardization (ISO).

For the purpose of this Ethiopian Standard, the adopted text shall be modified as follows.

- The phrase “International Standard” shall be read as “Ethiopian Standard”; and
- A full stop (.) shall substitute comma (,) as decimal marker.

Animal and vegetable fats and oils — Determination of lead by direct graphite furnace atomic absorption spectroscopy

1 Scope

This International Standard specifies a method for the determination of trace amounts ($> 0,001$ mg/kg) of lead in all types of crude or refined edible oils and fats.

2 Principle

The oil or fat is atomized in a graphite furnace, with or without a platform, connected to an atomic absorption spectrometer which has been previously calibrated using standard solutions of an organo compound of lead. The metal content is measured from the observed absorbance at a wavelength of 283,3 nm.

3 Reagents

Use only reagents of recognized analytical grade, unless otherwise specified, and distilled or demineralized water or water of equivalent purity.

3.1 Cyclohexane, analytical grade.

3.2 Lecithin, containing 2 % phosphorus.

3.3 Matrix modifier: 2 % (by mass/volume) lecithin solution prepared by dissolving 2 g of lecithin (3.2) in 100 ml of cyclohexane (3.1).

3.4 Blank oil, refined.

Any edible oil is suitable, stored in a metal-free polyethylene bottle. The lead content of the oil shall not be greater than 0,001 mg/kg.

3.5 Lead standard stock solution, $c(\text{Pb}) = 10$ mg/kg.

This is prepared by appropriate dilution of an organometallic standard with the blank oil (3.4).

NOTE A suitable standard is available from the following companies:¹⁾

- Continental Oil Company, Ponca City, Oklahoma, USA (Conostan, 5 000 mg/kg);
- Merck KGaA, Darmstadt, Germany [Certipur 115051, lead standard dissolved in oil, $c(\text{Pb}) = 1$ g/kg] in standard oil;
- VWR International [Certipur 1.15051, lead standard dissolved in oil, $c(\text{Pb}) = 1$ g/kg] in standard oil;
- VWR International [Specpure ALFA019527.AD, lead, Organic AAS standard solution, Specpure, $c(\text{Pb}) = 1$ 000 mg/g].

1) These are examples of suitable products available commercially. This information is given for the convenience of users of this International Standard and does not constitute an endorsement by ISO of these products.

3.6 Lead standard working solutions: $c(\text{Pb}) = 0,02 \text{ mg/kg}$, $0,05 \text{ mg/kg}$ and $0,100 \text{ mg/kg}$, prepared daily by diluting the 10 mg/kg stock solution (3.5) with blank oil (3.4).

3.7 Argon, of minimum purity 99,99 %.

4 Apparatus

4.1 Polyethylene or polypropylene capped bottles, 20 ml, metal free.

The polyethylene or polypropylene capped bottles are made metal free in the following way. Clean the bottles thoroughly with warm nitric acid, rinse with distilled water and dry the bottles in a drying oven at about 80°C .

4.2 Micropipettor, 20 μl .

4.3 Pipettor tips.

4.4 Electric oven, regulated at $60^\circ\text{C} \pm 2^\circ\text{C}$.

4.5 Atomic absorption spectrometer, equipped with either "peak height" mode and printer, or "area" mode and pen-recorder (full-scale response in 0,2 s), together with the appropriate electrode-less discharge lamp (or hollow cathode lamp) and deuterium or Zeeman background corrector.

4.6 Graphite furnace atomizer, placed in the atomic absorption spectrometer (4.5), equipped with a control unit for temperature programming.

4.7 Graphite tube, normal (uncoated) or coated (pyrolytic).

4.8 Pyrolytic platform, in combination with uncoated or pyrolytically coated graphite tube.

Both atomization with and without the platform may be used. The accuracy and the sensitivity with the platform is twice as good as without the platform.

5 Sampling

Laboratory samples of at least 1,5 g shall be stored in metal-free bottles (4.1).

It is important that the laboratory receive a sample that is truly representative and has not been damaged or changed during transport or storage.

Sampling is not part of the method specified in this International Standard. A recommended sampling method is given in ISO 5555.

6 Procedure

6.1 Treatment of samples, blanks and standards

6.1.1 Place all samples and standard working solutions (3.6) in the oven (4.4) set at 60°C .

6.1.2 Shake samples vigorously.

6.1.3 Weigh 5,0 g of sample into a 20 ml bottle (4.1), together with 5,0 g of matrix modifier (3.3), and mix thoroughly.

6.1.4 Carry out steps 6.1.2 and 6.1.3 also for the three standard working solutions (3.6) and the blank oil (3.4).

6.2 Preparation of apparatus

6.2.1 Switch on the atomic absorption spectrometer (4.5) and the background correction (D_2 or Zeeman).

6.2.2 In accordance with the manufacturer's instructions supplied with the spectrometer, adjust the lamp current, slit, wavelength and amplification. The required wavelength is 283,3 nm.

6.2.3 Optimize the position of the graphite furnace atomizer (4.6) in the atomic absorption spectrometer and set the required programme on the control unit of the furnace. Use the measuring parameters given in Tables 1 and 2. If available, place the platform (4.8) in the graphite tube.

6.2.4 Before each injection, pretreat the pipettor tip (4.3) by pipetting and then discarding 20 μ l of cyclohexane.

Programmes for the graphite furnace atomizer are given in Tables 1 and 2.

Table 1 — Uncoated tube without platform, with maximum power heating and gas-stop

Step No.	Temperature °C	Ramp-time s	Hold-time s	Internal gas flow ml/min
1	100	10	20	300
2	650	60	40	300
3	1 900	0	5	0
4	2 700	1	3	50

Table 2 — Pyro-coated tube with platform, with maximum power heating and gas-stop

Step No.	Temperature °C	Ramp-time s	Hold-time s	Internal gas flow ml/min
1	200	10	20	300
2	650	60	40	300
3	1 700	0	5	0
4	2 700	1	3	50

6.3 Determination

6.3.1 Measurement of blank solution

Inject 20 μ l of the blank solution, prepared according to 6.1.4, into the graphite furnace. Initiate the temperature programme and record the absorption.

6.3.2 Measurement of standard solutions

Inject 20 μ l of the three standard solutions, prepared according to 6.1.4, into the graphite furnace and record the absorptions.

6.3.3 Measurement of sample solutions

Inject 20 μ l of the sample solution, prepared according to 6.1.3, into the graphite furnace. Initiate the temperature programme and record the absorption.

7 Calculation and expression of results

7.1 Calculation

7.1.1 Measure the peak height on the recorder-chart or take the reading of the display or printer.

7.1.2 Draw a calibration curve by plotting the absorption of the three standard solutions (6.3.2), corrected for the blank (6.3.1), against their respective metal content.

NOTE With the use of sophisticated equipment, autocalibration can be applied.

7.1.3 Read the metal content of the sample from the calibration curve.

7.2 Expression of results

Express the results as milligrams per kilogram (to two significant figures).

8 Precision

8.1 Interlaboratory test

Details of an interlaboratory test on the precision of the method are summarized in Annex A. The values derived from this interlaboratory test may not be applicable to concentration ranges and matrices other than those given.

The method has been tested with liquid oil (soyabean oil) and with solid fat (cocoa butter).

8.2 Repeatability limit

The absolute difference between two independent single test results, obtained with the same method on identical test material in the same laboratory by the same operator using the same equipment within a short interval of time, will not in more than 5 % of cases be greater than the repeatability limit (r) as calculated from the formulae in Table 3.

Table 3 — Repeatability (r) and reproducibility limits (R)

	r	R
Pb in edible oil	0,19 M	0,30 M
Pb in cocoa butter	0,15 M	0,68 M
NOTE M is the corresponding mean concentration value.		

8.3 Reproducibility limit

The absolute difference between two single test results, obtained with the same method on identical test material in different laboratories with different operators using different equipment, will in not more than 5 % of cases be greater than the reproducibility limit (R) as calculated from the formulae in Table 3.

8.4 Trueness (bias)

The bias of the method was demonstrated in the collaborative study of the method (see Table A.1) to be negligible when used for the determination of concentration levels of lead in the range 0,01 mg/kg to 0,10 mg/kg.

8.5 Sensitivity

The sensitivity of the method is demonstrated by the low values for ρ and P at the low concentration levels studied (see Table A.1). The limit of detection is 0,001 mg/kg and the limit of determination is 0,01 mg/kg.

Interference by other elements is not to be expected, provided that the measurements are carried out at the wavelength specific for lead (283,3 nm).

9 Test report

The test report shall specify:

- a) all information necessary for the complete identification of the sample;
- b) the sampling method used, if known;
- c) the test method used, with reference to this International Standard;
- d) all operating details not specified in this International Standard, or regarded as optional, together with details of any incidents which may have influenced the test result(s);
- e) the test result(s) obtained, or, if the repeatability has been checked, the final quoted result obtained.

Annex A (informative)

Results of interlaboratory test

An interlaboratory test was carried out at the international level in 1988 by the IUPAC Commission on Oils, Fats and Derivatives, in which 20 laboratories participated, each obtaining two test results for each sample. The statistical results obtained (evaluated in accordance with ISO 5725:1986)²⁾ are summarized in Table A.1.

Table A.1 — Statistical results

	Sample					
	Soyabean oil			Cocoa butter		
	A	B	C	A	B	C
Number of laboratories retained after eliminating outliers	14	14	14	16	16	16
Number of outliers (laboratories)	6	6	6	4	4	4
Number of accepted results	112	112	112	128	128	128
Mean value (mg/kg sample)	0,087	0,053	0,022	0,087	0,054	0,026
True or accepted value (mg/kg)	0,085	0,050	0,020	0,085	0,050	0,020
Repeatability standard deviation, s_r (mg/kg)	0,0059	0,0034	0,0022	0,0039	0,0031	0,0013
Repeatability relative standard deviation (%)	6,8	6,4	10,1	4,5	5,7	5,0
Repeatability limit (r) ($2,8 \times s_r$)	0,017	0,0095	0,0062	0,011	0,0087	0,004
Reproducibility standard deviation, s_R (mg/kg)	0,0089	0,0057	0,0034	0,0180	0,0117	0,0073
Reproducibility relative standard deviation (%)	10,2	10,9	15,4	20,6	21,7	27,7
Reproducibility limit (R) ($2,8 \times s_R$)	0,025	0,016	0,009	0,050	0,033	0,020

Organization and Objectives

The Ethiopian Standards Agency (ESA) is the national standards body of Ethiopia established in 2010 based on regulation No. 193/2010. ESA is established due to the restructuring of Quality and Standards Authority of Ethiopia (QSAE) which was established in 1970.

ESA's objectives are:-

- ❖ Develop Ethiopian standards and establish a system that enable to check weather goods and services are in compliance with the required standards,
- ❖ Facilitate the country's technology transfer through the use of standards,
- ❖ Develop national standards for local products and services so as to make them competitive in the international market.

Ethiopian Standards

The Ethiopian Standards are developed by national technical committees which are composed of different stakeholders consisting of educational Institutions, research institutes, government organizations, certification, inspection, and testing organizations, regulatory bodies, consumer association etc. The requirements and/or recommendations contained in Ethiopian Standards are consensus based that reflects the interest of the TC representatives and also of comments received from the public and other sources. Ethiopian Standards are approved by the National Standardization Council and are kept under continuous review after publication and updated regularly to take account of latest scientific and technological changes.

Orders for all Ethiopian Standards, International Standard and ASTM standards, including electronic versions, should be addressed to the Documentation and Publication Team at the Head office and Branch (Liaisons) offices. A catalogue of Ethiopian Standards is also available freely and can be accessed in from our website.

ESA has the copyright of all its publications. No part of these publications may be reproduced in any form without the prior permission in writing of ESA.

International Involvement

ESA, representing Ethiopia, is a member of the International Organization for Standardization (ISO), and Codex Alimentarius Commission (CODEX). It also maintains close working relations with the international Electro-technical Commission (IEC) and American Society for Testing and Materials (ASTM). It is a founding member of the African Regional Organization for standardization (ARSO).
